

## QUARTERLY REPORT FOR THE PERIOD ENDING 31 MARCH 2007

### HIGHLIGHTS

#### Greenvale (Qld)

- Remaining results received from RC Drilling at the Cockie Prospect, with significant intercepts of Cu-Au-Mo-Ag returned, including;
  - **66 m @ 0.61% Cu, 0.1 g/t Au, 1.4 g/t Ag, 170 ppm Mo, (inc. 8 m @ 1.0% Cu, 0.11 g/t Au, 2.2 g/t Ag, 400 ppm Mo),**
  - **21 m @ 0.7% Cu, 0.14g/t Au, 2.2 g/t Ag, 90 ppm Mo (inc. 8 m @ 1.0% Cu, 0.22 g/t Au, 3.7 g/t Ag)**
  - **33 m @ 0.6% Cu, 2.0 g/t Ag, 110 ppm Mo (inc. 7 m @ 0.9% Cu, 3.7 g/t Ag, 170 ppm Mo)**
- Regional soil sampling along the Cockie Trend defines a 5.5km long soil anomaly, with peak Cu to 0.14%, Au to 117ppb and Ag to 3400 ppb. Sampling to continue during the next quarter.
- A large Ni-Co-Cu-Zn soil anomaly named Corella discovered east of Cockie. The anomaly is 3.5km long, open to the south. Sampling to continue during the next quarter. Peak Ni to 0.12%, Co to 600 ppm.

#### Barlee (WA)

- A total of 4,400m of shallow Aircore drilling completed validating the new exploration model. Significant gold results include;
  - **4m @ 9.3g/t Au,**
  - **12m @ 2.1 g/t,**
  - **8m @ 2.7g/t (inc. 4m @ 5.0g/t)**
  - **8m @ 2.5g/t,**
  - **8m @ 2.4 g/t and 8m @ 1.7g/t (inc. 4m @ 3.0g/t)**
- Anomalous PGE, Ni and Cu in drilling highlights nickel potential
- Uranium anomalies identified in paleochannel system, new ELA pegged.

---

## **QUEENSLAND**

### **GREENVALE PROJECT - Cockie Prospect**

Assay results from the remainder of the RC programme (CRC004-14) were received during the quarter, with significant results presented in Attachment 1.

A total of 14 RC drill holes for 1,486 m were completed over 500 m of strike at the Cockie Prospect, which represents the first drilling in the Greenvale project area for 15 years. The drilling aimed to define the shallow oxide mineralisation at the Cockie Prospect, with additional holes drilled to +150 m depth testing deeper portions for primary sulphide mineralisation. All holes were drilled towards -60° to 328°, with the exception of CRC 013 which was drilled towards 128° due to rig access issues.

Drilling within the main area, named Cockie East, has outlined a southerly dipping zone approximately 300 m long at >0.5% Cu, together with significant gold, silver and molybdenum mineralisation. Cockie East remains open in all directions and at depth, although a fault is interpreted to offset the mineralisation slightly to the southeast. A location plan is presented as Attachment 2.

Preliminary exploration by Beacon, based on previous exploration activity, has identified a second zone of mineralisation called Cockie West. Drilling is planned during the next quarter between the two zones to determine the continuity of the Cockie East and West mineralised zones, both along strike and at depth.

Beacon has at least 22 kilometres of potentially mineralised strike along the Cockie trend to explore, with only 4% having been drill tested to date. The mineralisation occurs within and proximal to the contact between the Cockie Springs Tonalite, a porphyry intrusive rock as well as within metamorphosed sediments and volcanics belonging to the Lucky Creek Group. The base of oxidation lies at approximately 25-30m below surface. The Company is highly encouraged by the results of its first exploration drilling program at Greenvale, and believes that the porphyritic Cockie Springs Tonalite has the potential to host a number of significant mineralised zones, and is highly prospective for copper, gold, molybdenum and silver mineralisation.

Beacon has consolidated its position in the Greenvale region, by entering into a JV with Glengarry Resources to explore over 195 square kilometres of the Lucky Creek tenements, effectively tripling Beacon's tenement holdings in the area.

Combined with its wholly owned tenements, the JV provides Beacon with access to a number of base metal prospects, including One Mile Dam and Galah Dam, prospective for volcanic-hosted massive sulphide mineralisation (VMS), similar to Kagara Zinc's Balcooma, Surveyor and Dry River South deposits, located only 15 kilometres to the west.

An airborne EM (VTEM) survey has been commissioned and is scheduled to be flown during the June quarter. The survey will cover over 150 km<sup>2</sup> and it is aimed at detecting accumulations of sulphides that may be present beneath the soil and or transported cover.

---

---

## Regional Soil Sampling

During the quarter, results from sampling completed in Late December 2006 (990 samples) as well as a further 1,600 samples collected in January 2007 were received. The soil samples were collected on a regional 200m x 50m grid with infill to 100m x 50m completed to further define the anomalies. A location plan is shown as Attachment 3. Results are summarised below;

**Cockie Trend Anomaly** - Extended the strike length to over 5.5km along the main trend. Sporadic values along the trend potentially add another 1km of strike before being obscured by alluvial, transported cover.

Peak infill soil results included **1,400ppm (0.14%) Cu, 110 ppb Au and 3,400 ppb Ag.**

Drill targets have now been identified along strike from the Cockie East and West prospects.

**Corella Anomaly** - Extended the anomaly to over 3.5km, open to the south. Due to the proximity of the Greenvale Nickel Mine (12km east) and the high cobalt values obtained from the first phase of sampling, infill samples were also analysed for Nickel, which returned peak values to 0.12% , coincident with higher Cobalt and copper values. Peak soil test results include **300ppm Zn, 600ppm Co, 0.12% Ni and 300ppm Cu.** This anomaly also contained sporadic elevated silver to 700ppb, and gold to 34 ppb.

The soil anomalies have been contoured +100ppm Cu, 10ppb Au, 50ppm Zn and 50ppm Co and 100ppm Ni. These values are at least two to five times greater than background.

Any targets identified from the planned VTEM survey will also be incorporated into the RC drilling programme which is also planned to start in the June quarter. This drilling programme will test extensions to the known Cockie East and West Cu-Au-Ag-Mo mineralisation as well the new targets identified from the soil sampling.

## **New Exploration Permit Application (EPM 16176, Beacon 100%)**

Beacon applied for a new EPM at its Greenvale Project during the quarter. The licence lies along the eastern boundary of the current project area and increases Beacons tenure at the Greenvale project to over 400 sq km.

---

---

## WESTERN AUSTRALIA

### **Barlee Project**

The project is located 200km north of Southern Cross in Western Australia.

**Gold** - A total of 133 shallow, vertical Aircore drill holes for 4,400m were completed (BRB001-133) testing for oxide gold mineralisation along a newly identified structural orientation. Five prospects, including Halleys East, Phil and Russell were tested over 3km of strike. A location map is given as Attachment 5, with significant results presented as Attachment 7.

The drilling was designed to infill significant gold mineralisation recorded in historical shallow drilling, and intersected a package of variably sheared and altered mafic, ultramafic and porphyritic rocks weathered to depths of 40m down hole.

#### Halleys East Prospect

Drilling defined multiple zones of gold mineralisation within the oxide zone. At a >0.5g/t contour, the main zone at Halleys East is over 400m long, open to the south and at depth.

Significant intercepts are presented in Attachment 7, and include **4m @ 9.3 g/t Au, 8m @ 2.5g/t Au and 8m @ 2.7 g/t Au (inc. 4m @ 5.0g/t Au)**, which compliment historical intercepts from within this zone of 4m @ 5.3g/t (inc. 1m @ 14.2g/t), 13m @ 1.6g/t (inc. 1m @ 12.2g/t) and 2m @ 8.0 g/t Au. Further drilling along the structural trend is planned.

#### Phil Prospect

Located 1.6km north of Halleys East, Phil returned highly encouraging drill results. The mineralised zone is interpreted to be approximately 350m long and remains open to the south and at depth.

Significant results including **12m @ 2.1 g/t** and **27m @ 1.4 g/t Au (inc. 8m @ 2.4 g/t EOH)** were returned. Historical drilling along a single drill line some 150m southwest of Phil recorded +0.5 g/t mineralisation and may indicate the development of further zones. This area has never been followed up and is a priority target for follow-up drilling.

#### Russell Prospect

Located midway between Halleys East and Phil, the Russell Prospect is in an area where historical, selective assaying yielded results of 6m @ 5.4 g/t Au. Broad intercepts within the oxide profile over +0.5 g/t Au (**32m @ 0.8g/t, inc. 4m @ 3g/t Au**, 32m @ 0.5g/t) including several holes recording >1.0g/t at EOH, were recorded along a north-easterly trend.

Drilling by previous explorers along this trend 300m southwest returned >1.0g/t intercepts suggesting the presence of other mineralised zones. There is no drilling in between, and the area is a high priority target.

The company plans to recommence drilling at Barlee during the next quarter. This programme will target extensions to the known mineralized zones as well completing initial drilling on priority regional targets.

---

---

## **Nickel**

The Barlee Gold Project is located in the Southern Cross Greenstone Belt, which hosts several nickel mines in the south. Despite this, little if any nickel exploration appears to have been done in the northern part of this Greenstone Belt, including the area near Barlee. As ultramafic lithologies were observed in historical drilling, Beacon also assayed for PGE, Ni, and Cu and As.

A number of holes returned elevated PGE with corresponding Cu and Ni. Peak results of 0.21g/t PGE (Pt+Pd), 0.1% Cu and 0.2% Ni from holes that had variably sheared ultramafic lithologies at EOH were returned. As the drilling was not specifically targeting these ultramafic units, these results are seen as encouraging. It is estimated that over 25 strike kilometres of ultramafic exist within the project, and the Company intends to investigate this potential.

## **Uranium**

A large calcrete drainage system with several coherent uranium radiometric anomalies has been identified within the companies Barlee Project. Additional ground has also been applied for to cover the targets (ELA77/1392, BCN 100% - see Attachment 6).

The drainage system that hosts the largest uranium anomalies, named Mondie 1, 2 and 3 is over 16km long and up to 6km wide proximal to salt lakes with the companies ground.

Calcrete-hosted uranium deposits generally occur as shallow, 2-6m thick layers hosted in calcrete or playa/salt lake sediments. Better known examples include the Yeelirrie (35Mt @ 1.5kg/t  $U_3O_8$ ) and Lake Maitland (32Mt @ 0.33 kg/t  $U_3O_8$ ) deposits in Western Australia.

## **Pioneer Project**

Further planning of drill targets at Pioneer was completed during the quarter. An Aircore drilling programme is planned during the next quarter to test these targets. The Pioneer project lies in between Norseman and the Higginsville-Trident deposit, currently under development, and is prospective for gold and nickel.

---

---

## **CORPORATE**

### **Non-Renounceable Rights Issue of Options**

During the quarter, the company offered shareholders a non-renounceable offer to purchase one option for every two shares held. Each option was offered at an issue price of one cent each and each option issued will have an exercise price of 20 cents and expire on 31 August 2010.

A total of 16,925,000 options, exercisable at 20 cents each on or before 31 August 2010 were allotted and dispatched on 29 March 2007. The ASX code is BCNO.

### Notes

- 1 The quarterly report provides a basis for informing the market how the entity's activities have been financed for the past quarter and the effect on its cash position. An entity wanting to disclose additional information is encouraged to do so, in a note or notes attached to this report.
- 2 The "Nature of interest" (items 6.1 and 6.2) includes options in respect of interests in mining tenements acquired, exercised or lapsed during the reporting period. If the entity is involved in a joint venture agreement and there are conditions precedent which will change its percentage interest in a mining tenement, it should disclose the change of percentage interest and conditions precedent in the list required for items 6.1 and 6.2.
- 3 **Issued and quoted securities** The issue price and amount paid up is not required in items 7.1 and 7.3 for fully paid securities.
- 4 The definitions in, and provisions of, *AASB 1022: Accounting for Extractive Industries* and *AASB 1026: Statement of Cash Flows* apply to this report.
- 5 **Accounting Standards** ASX will accept, for example, the use of International Accounting Standards for foreign entities. If the standards used do not address a topic, the Australian standard on that topic (if any) must be complied with.
